

Project Design Phase

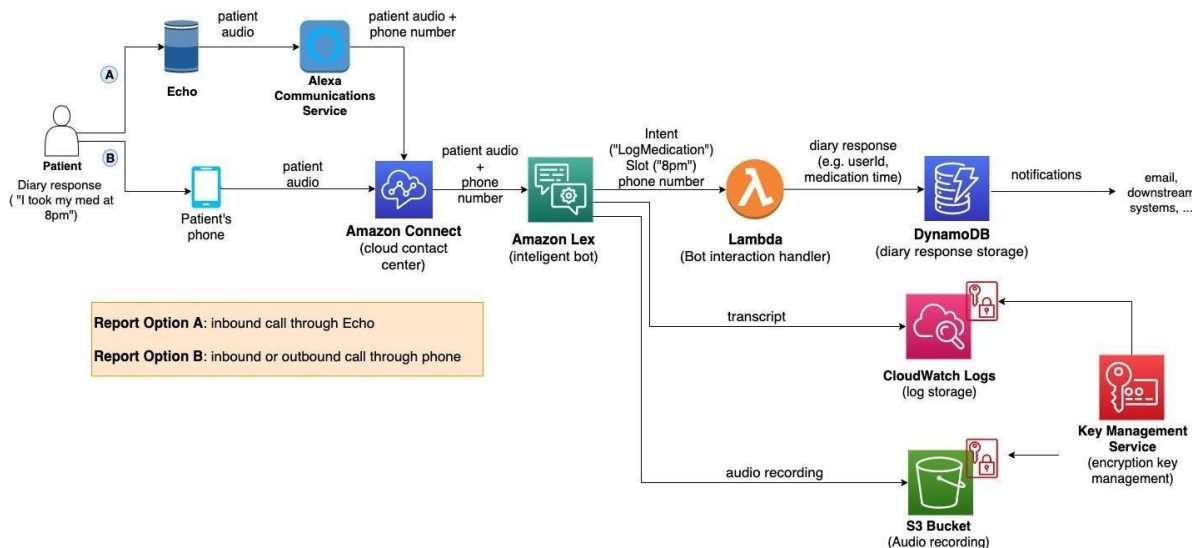

Solution Architecture

Date	1 October 2026
Team ID	
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- Find the best tech solution to solve existing business problems.
- Describe the structure, characteristics, behavior, and other aspects of the software to project stakeholders.
- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

In the context of Auto Ticket Classification using Flow Designer, the solution architecture defines an automated, no-code workflow in ServiceNow that processes incoming support and incident tickets in real time. Upon incident creation, a Flow Designer trigger evaluates the ticket text (Short Description & Description), identifies the appropriate Category and Subcategory based on rule logic, automatically updates the incident fields, and hands the ticket off for normal incident processing.
