

Auto Ticket Classification using Flow Designer

Author: Priyadharshini S | Context: School IT Helpdesk Automation Experience Map

Swimlane / Stage	STAGE 1: Entice Phase 1: Requirements	STAGE 2: Enter Phase 2: Setup	STAGE 3: Engage Phase 3: Backend Data	STAGE 4: Core Execution Phase 4: Flow Designer	STAGE 5: Exit Phase 5: Validation	STAGE 6: Extend Phase 6: Deployment
Steps What does the person typically experience?	Observe IT staff manually triaging tickets daily.	Create 'Project Update Set' in Global scope.	Create custom table 'Incident Workflow' and choices.	Build flow 'Auto Classify School IT Tickets'.	Submit test tickets (e.g. WiFi, Projector fail).	Mark Update Set as Complete and export XML.
Interactions People, Places, Things	People: Callers, IT Staff Place: Helpdesk Thing: Manual Request	People: Admin (Priyadharshini) Place: Studio Thing: Local Update Set	People: Admin Place: System Def Thing: Table, Choice Dict	People: Admin Place: Flow Designer Thing: Triggers, Data Pills	People: Callers, Agents Place: Email / Portal Thing: Test Record, Email Log	People: Deployment Lead Place: Prod Instance Thing: XML Package
Goals & Motivations Help me... / Avoid...	"Help me eliminate manual ticket sorting delays."	"Help me isolate changes in a dedicated update set."	"Help me enforce dependent subcategory choices."	"Help me classify tickets using keyword logic."	"Help me confirm auto-updates and caller notification."	"Help me export clean XML for easy migration."
Positive Moments Delightful & productive steps	Defining a clear no-code automation plan.	Successfully setting Update Set as Current.	Dynamic subcategory filtering on form reload!	Visual drag-and-drop logic configuration.	Category auto-populating instantly on save!	Generating portable XML package cleanly.
Negative Moments Frustrating or time-consuming	Manual triage causing routing errors and delays.	Risk of saving in Default update set by mistake.	Tedious manual mapping of choice values.	Handling user phrasing variations in description.	Troubleshooting email logs or trigger conditions.	Managing schema conflicts during XML import.
Areas of Opportunity Ideas for improvement	Survey staff for recurring issue keywords.	Enforce update set naming validation rules.	Add dynamic assignment group reference filters.	Integrate Machine Learning for fuzzy text search.	Add SLA timers to measure resolution speed.	Build executive dashboards for agent hours saved.
